## Battle rages in Fallujah

U.S. helicopters pumped missiles at insurgents in Fallujah today after warplanes pounded targets overnight. News footage shows plumes of smoke rising from near a train station as a Cobra attack helicopter and a Huey gunship copter swoop overhead. Tanks could be seen and gunfire could be heard.

BREAKING NEWS

## AMERICA UNDER ATTACK

At 8:45 a.m. EDT, the first of two airliners crashed into the World Trade Center, opening a horrifying and apparently coordinated terrorist attack on the United States, which saw the collapse of the two 110-story towers into surrounding Manhattan streets and a later attack on the Pentagon.

Home Edge Cloud functionality

P2P is  
**DOOMED**  
to failure

But others think different... Paul Franch, 10th WCW.

In the long run it is cheaper and easier to use Cloud computing and core networks to do Content Distribution rather than P2P

## P2P Success...?

Google trends search: p2p

# Today's world is centralized in the cloud

Cloud Computing, the long-held dream of computing as a utility, transformed a large part of the IT industry.

Instead of purchasing applications and installing them onto a computer, **cloud computing allows to lease the applications on demand and access them over the internet.**

- Adaptive subscription based model. Pay for what you use. SaaS, PaaS, IaaS,...
- Homogeneous workloads could seamlessly and cost-efficiently be used on commodity hardware
- Impacting performance with higher VM densities
- Costs and flexibility of use as the main drivers. Tap on the utility computing model using economies of scale.

## Negotiating premium peering prices: A quantitative model with applications

Costas Courcoubetis, Singapore University of Technology and Design  
 Laszlo Gyarmati, Qatar Computing Research Institute  
 Nikolaos Laoutaris, Telefonica Research and Development  
 Pablo Rodriguez, Telefonica Research and Development  
 Kostas Sdrolias, Athens University of Economics and Business

We have developed a novel methodology for deriving bandwidth prices for premium direct peering between Access ISPs (A-ISPs) and Content and Service Providers (CSPs) that want to deliver content and services in premium quality. Our methodology establishes a direct link between service profitability, e.g., from advertising, user- and subscriber-loyalty, interconnection costs, and finally bandwidth price for peering. Unlike existing work in both the networking and economics literature, our resulting computational model, built around Nash bargaining, can be used for deriving quantitative results comparable to actual market prices. We analyze the US market and derive prices for video, that compare favorably with existing prices for transit and paid peering. We also observe that the fair prices returned by the model for high-profit/low-volume services such as search, are orders of magnitude higher than current bandwidth prices. This implies that resolving existing (fierce) interconnection tussles may require per service, instead of wholesale, peering between A-ISPs and CSPs. Our model can be used for deriving initial benchmark prices for such negotiations.

Categories and Subject Descriptors: 500 [Networks]: Network economics

General Terms: Economics, Experimentation, Measurement

Additional Key Words and Phrases: Interconnection economics, pricing, premium service delivery, tussle analysis

### 1. INTRODUCTION

There are many “tussles” [Clark et al. 2005] affecting the Internet, ranging across regulation, privacy, network interconnection, and pricing. The economics of peering [Norton 2012], is among the thorniest, but yet, least understood ones. The term peering refers to the interconnection between networks for the purpose of exchanging traffic directly between them. Classic *unpaid peering* played a crucial role in the evolution of

# Innovation in services: The vCPE Principle

FROM...

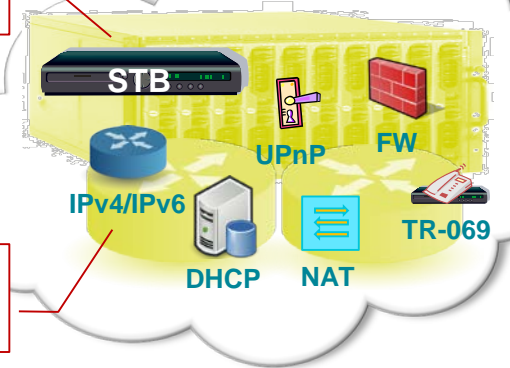

*Network environment*

... TO

Operation and service deployment are greatly simplified

*Network environment*

Simplification removes all incompatibilities

New functions (e.g. IPv6) only needed in network environment

Project Loon had been testing in Peru with telecom company Telefonica for months. So when flooding and mudslides ravaged Peru this spring, the infrastructure was already in place to provide emergency internet for those affected. The company [announced](#) its successful Peru efforts on Wednesday.

**USING A HIGH ALTITUDE PLATFORM (HAP) AS A RELAY SYSTEM INCREASES BANDWIDTH**

# Disruptive Edge Computing Where is the “killer app”?

Edge computing is still in its infancy and a framework to facilitate its adoption is not yet available.

Some use cases are only emerging (e.g. VR/AR will be a niche for some time and industrial IoT is a very narrow vertical).

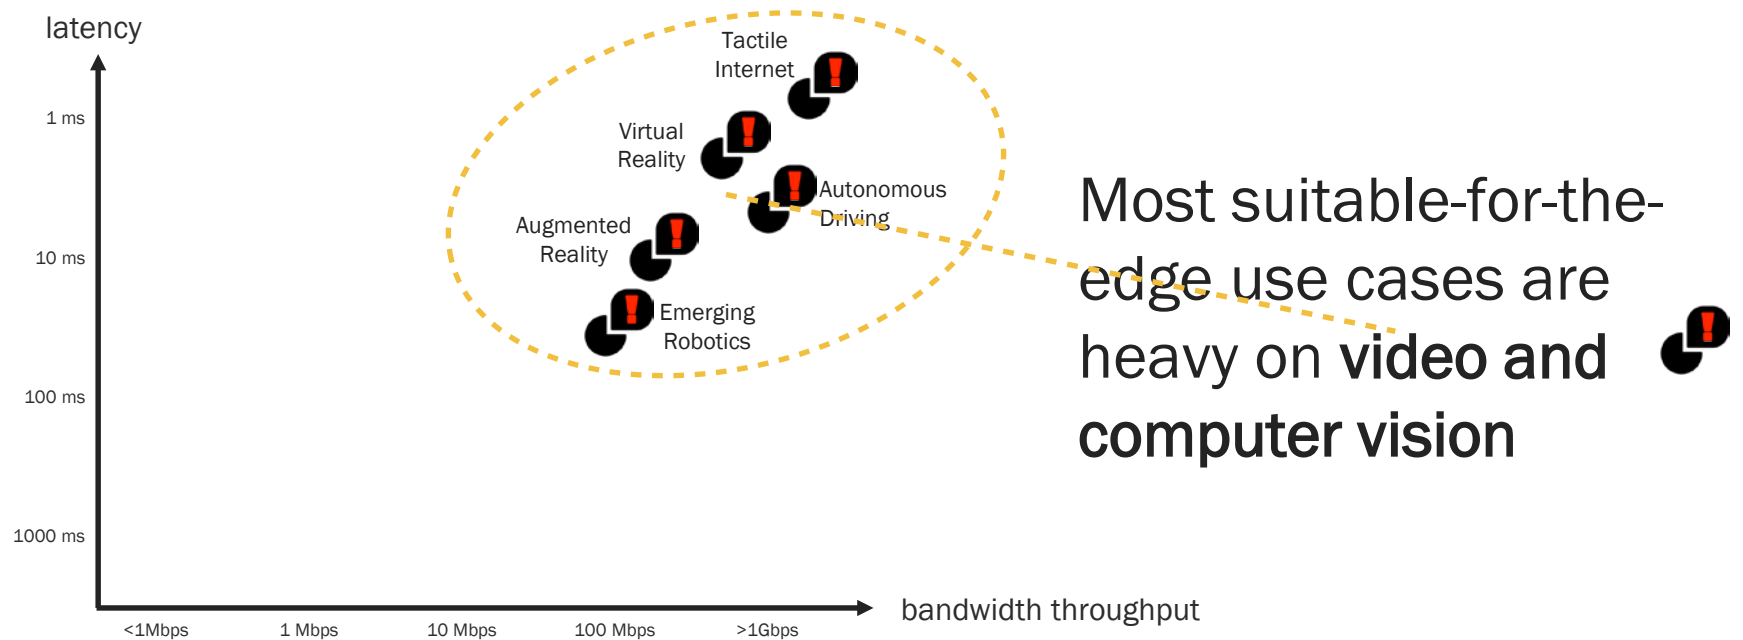

How to create the market demand? Nobody will develop apps that require <10ms latency unless there is enough demand for low latency apps. Biggest problem will be to break the cycle.

Biggest driver of the cloud is economic efficiency. **What is the economic incentive for edge computing?**

# The killer app will come from the sweet-spot between bandwidth & latency.

## THE ADVENT OF EDGE COMPUTING

# First, it's the AI, stupid.

**AI-powered applications will catalyze the adoption of edge computing.** It is all set to become the most preferred architecture for running data-driven, intelligent applications.

IDC estimates that today, only 1% of application across all industries have some type of cognitive technology.

**In two years that number will exceed 50%.**

Edge computing prioritizes agility over power. Endpoints will never be as powerful as the cloud can be. On the other hand, they gain agility from the speed of the information loop that occurs in the edge, processing just the information that is needed.

**The cloud will then become a place where learning happens.**

# AI Fields and Applications

## ENABLING EDGE COMPUTING

SENSE

Perception

Use input from sensors to deduce aspects of the world. Computer vision. Speech, facial and object recognition.

Social Intelligence

Recognise, interpret, process, and simulate human affects, emotions and social skills.

INFER

Knowledge Representation

Representation of "what exists", qualification and commonsense.

Natural Language Processing

Read and understand the languages that we speak. Machine translation.

Creativity

Systems that identify/assess creativity or generate outputs that can be considered creative.

ACT

Reasoning and problem solving

Make logical deductions dealing with uncertain or incomplete information.

Planning

Set goals and achieve them. Also in cooperation (swarm intelligence).

Motion and Manipulation

Robots to be able to handle such tasks as object manipulation and navigation.

LEARN

Algorithms that improve automatically through experience.

## Secondly, specialised hardware will be needed

To enable edge computing, besides AI processors and algorithms, there's the increasingly important task of creating **engineering systems to maximise performance.**

New and specialised chips and systems are needed to take AI to the next level. **Boutique chips will be developed to deliver better performance** and massively reduce training requirements and improve costs.

The objective is to build computational platforms that deliver the performance and energy efficiency needed **to build AI with a maximum level of accuracy.**

# Personal Data: Give Data and Value Back

- Individuals leave data traces (location, calls, web traces, shopping, etc)
- Such info is useful for Credit Ratings, Retail Industry, Govs, Online Advertising, Predictions and Analytics (Sexual Orientation, Political Views)
- Individuals have multiple virtual Data Souls and Personalities
- Individuals with access and control of that data could use it to their benefit
- We still live in a “data desert”: we don’t know much about ourselves or the world (where do people like me go, where is it safe, where can I find a job)
- Give value back to our customers

## - “For sale: Your Data: By you”, Hotnets 2011

Erramii et al, “For sale: Your Data: By You”,  
Hotnets 2011

# Personal Data Banks

Our data is fragmented across the web

Bringing it together unleashes its true potential

Exchanging it creates mutual benefits for all

future

## INDIVIDUAL AS THE NEW PLATFORM

- [www.rodriquezrodriquez.com](http://www.rodriquezrodriquez.com)

# 4 Main Takeaways

# The edge in a nutshell

 It's about moving **computation and storage closer to where data is created** and acted upon  
It's so far being transformational  
There will be many edges

 The disruptive opportunities will come from use cases that require high bandwidth and low latency; **mainly video and computer vision.**

 **The Edge will enable AI in Real Time as a service**

 **Specialised Hardware will be the catalyser**

 It will require really huge investments and cross industry strategic partnerships with sticky relationships. **It will not happen by chance.**

 Privacy, Security and Data Value and control will drive a large percentage of Edge use cases
